

Corn Cob

Vegetable bedding entirely made of corn cobs. They are 100% natural with no additives and are bio-degradable.

The Caipet Corn Cobs provide bottom up absorption. This keeps lab animals on a dry surface between bedding changes. They are produced in a clean, modern plant, and regularly subjected to independent laboratory analysis. Corn cobs are heat-treated and air cleaned; so they are virtually dust free.

The Caipet Corn cobs offer superior ammonia control and are especially effective in micro-isolator cages.

The Corn cobs do not cause allergies to animals, thanks to their natural composition that prevents the onset of bad odors.

Prepared in autoclavable bags of 12,5kg and 20kg. Each bag is individually labeled with batch number and production date.

OPTIONS

- Irradiation
- Double Packaging

High absorption: 4l/Kg
Absorbs natural odours
Very low dust content
100% natural bio degradable product
Density: 500-600g/l
Humidity: Max 5%
PH: 5,5 +0,5

CAIPET produces virgin wood bedding for laboratory animals. It is a new, young and booming corporate reality. Born from an entrepreneurial idea, CAIPET aims at satisfying the needs of the market research laboratories in Europe.

Our production process results in bedding with a high absorption capacity and a very low dust index.

In order to ensure the quality our bedding is subjected to regular microbiological and pesticides screens carried out by certified independent laboratories: thereby CAIPET guarantees the absence of contaminants.
